

Husqvarna Hiperhard™ – densification.

Hiperhard™ is a further treatment product in the Hiperfloor™ process. It is a silicate applied to the concrete surface to react with the calcium hydroxide (already existing in the concrete). A crystalline /glassy structure is formed in the pores of the concrete near the surface and is a main contributor to increasing the surface hardness of the concrete. The combination of calcium silicate forming in the concrete along with polishing of the concrete with resin bonded diamonds, significantly hardens the floor and improves the abrasion resistance as well having a significant impact on the appearance of the final floor.
